

Health Effects of Perlite

The perlite industry is conscious of its societal responsibility to test their products and to determine what, if any, health effects may be associated with them. The industry is committed to producing safe products.

1. Background and Uses of Perlite

Perlite has been mined, processed, and used safely for over fifty years. With government approval, perlite is used in a variety of applications. For example, it is used:

- as a filteraid in water purification
- for the clarification of foods, wines, and other beverages
- in the purification of pharmaceuticals
- as an anti-caking agent
- in association with the processing, transporting or storage of meat or poultry food products prepared under federal inspection.

It is also used:

- as a horticultural aggregate in potting soil
- as a hydroponic growing media
- as a lightweight material for concrete
- as a filler in construction products.

2. Results of Health Testing

The perlite industry has been at the forefront of testing for health effects that may be associated with perlite and perlite products. Much of the industry research effort is sponsored by the Perlite Institute, an international trade association organized in 1949 by perlite mining and processing companies.

Perlite has been the subject of numerous health studies conducted by scientific and governmental research organizations. Significantly, no test result or information indicates that perlite poses any health risk. Indeed, the uniform result of all health studies points forcefully to the conclusion that perlite and perlite products are safe for consumer use.

Worker health studies provide direct support for the conclusion that perlite is a safe product. For example, studies by Cooper (1975; 1976), Cooper and Sargent (1986), and Weill (1990;1994) indicate that perlite poses no significant respiratory health risk to workers. As with all workplace dusts, perlite can function as a nuisance. For some workers, exposure can result in temporary physical irritation, discomfort, impaired visibility, and enhancement of accident potential. However, the most recent health study (1994) of perlite by Dr. Hans Weill of Tulane University concluded that workers exposed to perlite are free of any measurable adverse respiratory effects.

For Further Information

Additional information about perlite and about the results of health testing can be obtained by contacting: the Perlite Institute at <http://www.perlite.org>.
