

Oil-Fix[®]: test at the central firebrigade school Tulln, Austria

Oil- & chemicals-binder in durability-test at the central firebrigade school Tulln.

On June 26th 2001 OBI Turban (chief) together with head of school Mr. Eigenschink and his deputy Mr. Staud, accompanied by Mr. Bauer, Mr. Birnecker, Mr. Bogner, Mr. Grammer, Mr. Krappl and Mr. Scharl tested the products of the Austrian traditional company **Europerl**.

Two different Oil- & Chemicals-binders were tested:

Oil-Fix[®]- W is a floatable oil-binder Type I, II-R and IIR, usable on rivers and land. The application can be by pouring, dispersing or even sprinkling

with water-jet-nozzles. The saturated oil-binder is collected by sweeping, vacuum cleaning or using nets.

More advantages are the easy demarcation by floating barriers and the easy collectibility on coastlines and river slopes. At the tests 2 liters of diesel-fuel-mixtures were applied to the pan and all over dispersed. Then **Oil-Fix[®]- W** was applied on the surface. After a few minutes **Oil-Fix[®]- W** was saturated. 2 liters of **Oil-Fix[®]- W** were enough to bind 2 liters of oil. The manufacturers information of 30 – 50% binding capacity were exceeded by the double value: **100% of binding capacity!**

At collection with a sieve no drip down occurred.

The same good results were achieved testing the extreme difficult diesel-benzine-mixture: 80% of binding capacity.

Oil-Fix[®]- H is a floatable oil-binder Type III, usable inside

and outside. It is the weight increased version of the W-type without is floating capability. These tests were as well successful and the attendants could determine that after removal the surface was mostly free of oil and not slippery. Even oil-barriers can be made with **Oil-Fix**. Both binders convinced by easy and drop-free collectibility and are disposable both classical and ecological.
